Adult Blood Pressure

KEY POINTS

- BP is an important and modifiable risk factor for cardiovascular disease (CVD).
- In adults with elevated BP or hypertension, encourage a low sodium, high potassium, heart-healthy diet, physical activity, weight control, and limited alcohol use.
- To further promote vascular health, follow KP Guidelines to treat cholesterol and/or diabetes mellitus (DM), recommend aspirin use, and promote smoking cessation and adherence to medication and monitoring.
- Treat adults with hypertension to a goal BP < 140/90 mmHg.
- In adults with ASCVD, CKD, age ≥ 75 years, or 10-year ASCVD risk** ≥ 10%, consider treating to a goal SBP of < 130 mmHg.
- In adults with ASCVD, CKD, age ≥ 75 years, or 10-year ASCVD risk** ≥ 10%, consider treating to a goal SBP of < 130 mmHg.

Exclude adults with estimated glomerular filtration rate (eGFR) < 20 mL/min/1.73² from this lower target.

DEFINITIONS

- KP National BP categories are defined in Table 1.

Table 1: BP CATEGORIES

<table>
<thead>
<tr>
<th>BP Category</th>
<th>Systolic Blood Pressure (SBP) mmHg</th>
<th>Diastolic Blood Pressure (DBP) mmHg</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>&lt; 120 and</td>
<td>&lt; 80</td>

<td>80 – 89</td>
</tr>
<tr>
<td>Hypertension*</td>
<td>≥ 140* or</td>
<td>≥ 90</td>
</tr>
</tbody>
</table>

(Updated February 2019)

- *Hypertension may also be diagnosed in adults with SBP 130-139, when starting or taking a blood pressure medicine, and with at least one of the following: ASCVD, CKD, age ≥ 75 years, or 10-year ASCVD risk** ≥ 10%.
- BP values in this table and elsewhere in this document refer to standard office BP measurements unless otherwise specified. See Table 2 for corresponding SBP/DBP values.
- ASCVD, atherosclerotic cardiovascular disease. CKD, chronic kidney disease.
- 10-year ASCVD risk** is the risk of fatal or nonfatal myocardial infarctions or strokes in adults.
**A region may choose which tool (and corresponding cut-point) to use for calculating 10-year ASCVD risk based on regional needs. Kaiser Permanente ASCVD Risk Estimator (KPARE) of 10% correlates approximately with ACC/AHA ASCVD Risk of 15% and Framingham Risk Score of 15% (used in SPRINT) at the population level.**

### SCREENING

Screening and Diagnosis of High Blood Pressure

- Screen adults aged ≥ 18 years for high BP.
  - In adults aged 18-39 years with BP < 130/85 mmHg without other risk factors, screen every 3 to 5 years.
  - In adults aged ≥ 40 years and those at increased risk of high BP, screen annually. Adults at increased risk include those who have BP ≥ 130/85 mmHg or are overweight, obese, or Black/African American.
- Obtain measurements outside of the clinical setting for diagnostic confirmation before starting treatment.
- BP readings equal to or higher than those in Table 2, Row 1 confirms the diagnosis of hypertension. Use clinical judgment or regional protocol if obtaining BP outside the clinical setting is not possible. Automated office blood pressure (AOBP) measurements at ≥ 2 visits may be used.
- Diagnose hypertension for BP ≥ 180/110 at a single office reading or ≥ 150/100 with clinical evidence of target organ damage (left ventricular hypertrophy, hypertensive retinopathy, or hypertensive nephropathy).

<td>130/85</td>
<td>130/85</td>
<td>110/70</td>
<td>125/80</td>
</tr>
</tbody>
</table>

**Office BP**: Taken in the clinic setting using an oscillometric (preferred) or aneroid device but not including automated office BP.

**AOBP**: Taken in the clinic setting using a commercially available device that allows for measurements to be taken with patient unobserved.

**Home BP Monitoring (Home BPM)**: Taken by the patient at home (see Box 1).

**Ambulatory BP Monitoring (ABPM)**: Taken at regular intervals by a device worn by the patient, usually for 24 hours.
FIGURE 1: OPTIMAL HOME BP MEASUREMENT

- The patient should measure 2 sets of 2-3 readings each day: one set in the AM and one set in the PM.
- AM and PM sets from at least three days over the course of one week should be collected.
- The first set should start after 5 minutes of rest with additional readings at 1-minute intervals.
- Average the lowest readings from each day’s AM and PM set.
- Encourage patients to validate their device with an office device annually.
- Member education resources may be available for your region in HealthConnect, in the Clinical Library, or see the SCAL or NCAL versions.

TREATMENT INITIATION, BLOOD PRESSURE TARGETS, AND TYPICAL TESTS

ALL ADULTS

- In adults with confirmed hypertension, initiate pharmacologic treatment to lower BP at SBP ≥ 140 mmHg or DBP ≥ 90 mmHg and treat to a goal SBP < 140 mmHg and goal DBP < 90 mmHg (Table 2, Row 1).

SBP < 130 mmHg

- In adults with ASCVD, CKD, age ≥ 75 years, or 10-year ASCVD risk** ≥ 10%, consider pharmacologic treatment at SBP ≥ 130 mmHg and treat to a goal SBP of < 130 mmHg (Table 2, Row 2). Incorporate BP monitoring details, medication benefits and risks, and patient preferences when deciding whether to treat to this lower target.

  Exclude adults with eGFR < 20 mL/min/1.73² from this lower target.

**A region may choose which tool (and corresponding cut-point) to use for calculating 10-year ASCVD risk based on regional needs. KPARE of 10% correlates approximately with ACC/AHA ASCVD Risk of 15% and Framingham Risk Score of 15% (used in SPRINT) at the population level.

DM

- DM alone does not qualify for goal SBP < 130 mmHg. DM is a variable in KPARE.

ELDERLY OR FRAIL ADULTS
• Because elderly or frail adults are at higher risk for postural hypotension, check standing BP to guide treatment decisions.
• Incorporate BP monitoring details, medication benefits and risks, and patient preferences in elderly or frail adults.

DOWN-TITRATION

• Consider down-titration of BP medication in adults with SBP < 110 mmHg without other indications for medication, such as heart failure, or with symptoms of orthostasis.

TYPICAL TESTS

• Typical tests for adults with a new diagnosis of hypertension may include: fasting glucose or hemoglobin A1C, lipid panel, creatinine with eGFR, sodium, potassium, calcium, thyroid stimulating hormone, complete blood count, urinalysis, and electrocardiogram.

PHARMACOTHERAPY AND MONITORING

ATTAIN AND MAINTAIN GOAL BP

• The main objective of BP treatment is to attain and maintain goal BP. If goal BP is not reached within a month of treatment, consider increasing the dose of the initial drug or add a second drug from one of the thiazide-type diuretic, angiotensin-converting enzyme inhibitor (ACEI), angiotensin receptor blocker (ARB), or calcium channel blocker (CCB) classes. The clinician should consider continued assessment of BP and adjustment of the treatment regimen until goal BP is reached. If goal BP cannot be reached with 2 drugs, consider adding and titrating a third drug from the indicated classes. If goal BP cannot be reached using only the drugs in these classes because of contraindications or the need for > 3 drugs to reach goal BP, antihypertensive drugs from other classes can be considered. Consider referral to a hypertension specialist for patients in whom goal BP cannot be attained using the above strategy or for the management of complicated patients for whom additional clinical consultation is needed.

DRUG-DRUG INTERACTION

• Simultaneous use of an ACEI, ARB, and/or renin inhibitor is potentially harmful and is not recommended.

INITIAL THERAPY

• Initial single pill combination therapy with lisinopril-hydrochlorothiazide is preferred. This may be used as initial therapy in all adults.

CKD
• In adults with CKD, regardless of race, consider initial (or add-on) treatment that includes an ACEI or ARB to improve kidney outcomes.

BLACK/AFRICAN AMERICAN
• In Black/African American adults without heart failure or CKD, initial treatment should include a thiazide diuretic or CCB.

CAD, HF, DM
• KP Guideline recommendations for coronary artery disease, heart failure, and DM may inform medication use independent of BP in certain individuals.

THREE MEDICATIONS
• If BP is not controlled within a month of treatment on a thiazide-type diuretic plus ACEI, then add a CCB.

FOUR MEDICATIONS
• If BP is not controlled within a month of treatment on a thiazide-type diuretic plus ACEI plus CCB, then add spironolactone (if on thiazide AND eGFR ≥ 60mL/min/1.73 m² AND potassium < 4.5 mEq/L). If criteria for use of spironolactone are not met, use beta blocker as fourth agent.

WOMEN OF CHILDBEARING POTENTIAL
• Half of all pregnancies are unplanned. Do not prescribe medications contraindicated in pregnancy, such as ACEIs/ARBs, to women of childbearing potential, unless there is a compelling indication. For women of childbearing potential taking medications contraindicated in pregnancy, such as ACEIs/ARBs:
  o Discuss potential risks to the fetus if they become pregnant. Discuss practicing contraceptive measures with extremely low failure rates (sterilization, implant, or IUD).
  o Advise women using ACEIs/ARBs to stop these medications and advise all women with hypertension to contact their OB/GYN provider immediately if they become pregnant.

MONITORING
• In adults with controlled hypertension, monitor BP at least annually.
• Self-monitoring of BP and team-based care can help achieve BP control.
Figure 2: Management of Adult Blood Pressure (BP)

**BP GOALS**
- Treat adults with confirmed hypertension to a goal BP < 140/90 mm Hg.
- In adults with ASCVD, CKD, age ≥ 75 years, or 10-year ASCVD risk³ ≥ 10%, consider treating to a goal SBP < 130 mm Hg. (Exclude adults with eGFR ≤ 20 from this lower target.)

<table>
<thead>
<tr>
<th>ACE Inhibitor / Thiazide Diuretic</th>
<th>Thiazide Diuretic²</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lisinopril / HCTZ (advanced as needed)</td>
<td>HCTZ 25 mg ⇒ 50 mg OR Chlorthalidone 12.5 mg ⇒ 25 mg</td>
</tr>
<tr>
<td>20/25 mg X ½ daily</td>
<td>If ACEI intolerant or pregnancy potential</td>
</tr>
<tr>
<td>20/25 mg X 1 daily</td>
<td>Thiazide Diuretic²</td>
</tr>
<tr>
<td>20/25 mg X 2 daily</td>
<td>For ACEI intolerance due to cough, use ARB²</td>
</tr>
</tbody>
</table>

**ACEI Inhibitor / Thiazide Diuretic**
- Lisinopril / HCTZ (advanced as needed)
- Pregnancy potential: avoid ACE inhibitors¹

**Calcium Channel Blocker (CCB)**
- Add amlodipine 2.5 mg daily ⇒ 5 mg daily ⇒ 10 mg daily

**Spironolactone* - Aldosterone Receptor Antagonist (ARA)**
- Spironolactone 12.5 mg ⇒ 25 mg daily
- *If on thiazide AND eGFR ≥ 60 mL/min/1.73 m² AND potassium < 4.5 mmol/L
- If spironolactone eligibility criteria not met:
  - Bisoprolol 2.5 mg ⇒ 5 mg daily ⇒ 10 mg daily
  - Titrate to BP; maintain pulse of > 55

**Consideration of Medication Non-adherence**
- Consider interfering agents (e.g., NSAIDs, excess alcohol).
- Consider white-coat effect. Consider BP checks by medical assistant, AOBP, or outside the office.
- Consider discontinuing Lisinopril/HCTZ and changing to chlorthalidone 25 mg plus lisinopril 40 mg daily.
- Consider additional agents (hydralazine, terazosin, minoxidil).
- Consider stopping beta blocker and adding diltiazem to amlodipine, maintaining heart rate > 55.
- Avoid using clonidine, verapamil, or diltiazem with a beta blocker. These heart rate-slowing drug combinations may cause symptomatic bradycardia over time.
- In adults with eGFR < 30-40 mL/min/1.73³, change thiazide diuretic to furosemide twice daily or torsemide daily.
- When bisoprolol is used in adults with eGFR ≤ 40 mL/min/1.73³, start bisoprolol at 2.5 mg and advance cautiously.
- Consider secondary etiologies.
- Consider consultation with a hypertension specialist.

---
¹ ACE inhibitors and ARBs are contraindicated in pregnancy and not recommended in most women of childbearing age. In Black/African American adults without heart failure or CKD, initial treatment should include a thiazide diuretic or CCB.
² For adults aged 18-75 with CKD, intolerant to ACEI with cough, and no pregnancy potential, losartan should be started before adding thiazide.
³ A region may choose which tool (and corresponding cut-point) to use for calculating 10-year ASCVD risk based on regional needs. ePARE of 10% correlates approximately with ACC/AHA ASCVD Risk of 15% and Framingham Risk Score of 1.5% (used in SPRINT) at the population level.
LIFESTYLE, OTHER RISK FACTORS, AND ADHERENCE

LIFESTYLE

- In adults with BP ≥ 120/80 mmHg:
  - A low sodium, high potassium, heart-healthy diet, such as the DASH (Dietary Approaches to Stop Hypertension) diet is recommended.
  - Increased physical activity with a structured exercise program is recommended.
  - Weight loss in adults who are overweight or obese is recommended.
  - Men and women who currently consume alcohol should be advised to drink no more than 2 and 1 standard drinks* per day, respectively.

*In the United States, 1 standard drink contains approximately 14 g of pure alcohol, typically found in 12 oz of regular beer (approximately 5% alcohol), 5 oz of wine (approximately 12% alcohol), and 1.5 oz of distilled spirits (approximately 40% alcohol).

OTHER RISK FACTORS

- To further promote vascular health, follow KP Guidelines to treat cholesterol and diabetes mellitus, recommend aspirin use, and promote tobacco cessation.

ADHERENCE

- Encourage adherence to medications and monitoring. Help overcome barriers.
  - Once-daily and combination pills can help minimize pill burden (number of daily pills needed), number of medication copays, and inconvenience.
  - Explore and help overcome barriers to medication adherence and monitoring. Collaborate with patients, families, caregivers, and the care team to problem solve and implement solutions.
  - Address depression and anxiety issues to maximize patient adherence. See KP National Depression Guideline.
  - Educate patients about their goal BP because patients who are knowledgeable about their goal BP are more likely to achieve it.

ABOUT THIS RESOURCE

This Clinician Guide is based on the 2019 KP National Blood Pressure (BP) Guideline. It was developed to assist primary care physicians and other health care professionals in the outpatient setting with screening and treatment of elevated BP in non-pregnant adults aged ≥ 18 years. The KP National BP Guideline was revised after review of the 2017 ACC/AHA/AAPA/ABC/ACPM/AGS/APhA/ASPC/NMA/PCNA Guideline for the Prevention, Detection, Evaluation, and Management of High Blood Pressure in Adults. It is not intended or designed as a substitute for the reasonable exercise of independent clinical judgment by practitioners.

- **Last Review:** February 2019
- **Next Review:** February 2021

DISCLAIMER

This guideline is informational only. It is not intended or designed as a substitute for the reasonable exercise of independent clinical judgment by practitioners, considering each patient’s needs on an individual basis. Guideline recommendations apply to populations of patients. Clinical judgment is necessary to design treatment plans for individual patients.

This guideline expires within two years of the posted month.
